

## National Risk Assessment Partnership (NRAP)

Grant S. Bromhal  
NRAP Technical Coordinator  
Geosciences Division

# National Risk Assessment Program (NRAP)

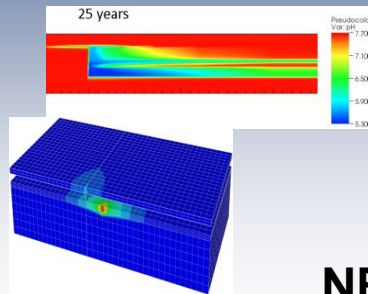

*Develop a defensible, science-based methodology and platform for quantifying risk profiles at most types of CO<sub>2</sub> storage sites in order to guide decision making and risk management by reducing uncertainty in the business case for long-term storage.*

Elucidate  
key fundamental  
physics/chemistry

Predict behavior of  
critical components

Predict system behavior  
(reservoir to receptor)  
over space and time

Quantify  
risk and safety  
relationships

NRAP Technical Team

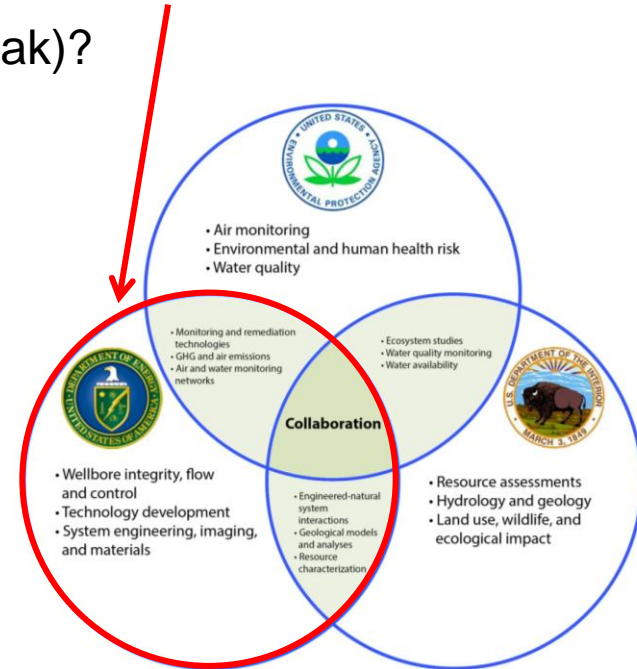

NRAP Stakeholder Group

# National Risk Assessment Partnership:

*Leveraging DOE's Science-Based Prediction Capability  
to Build Confidence in Engineered–Natural Systems*

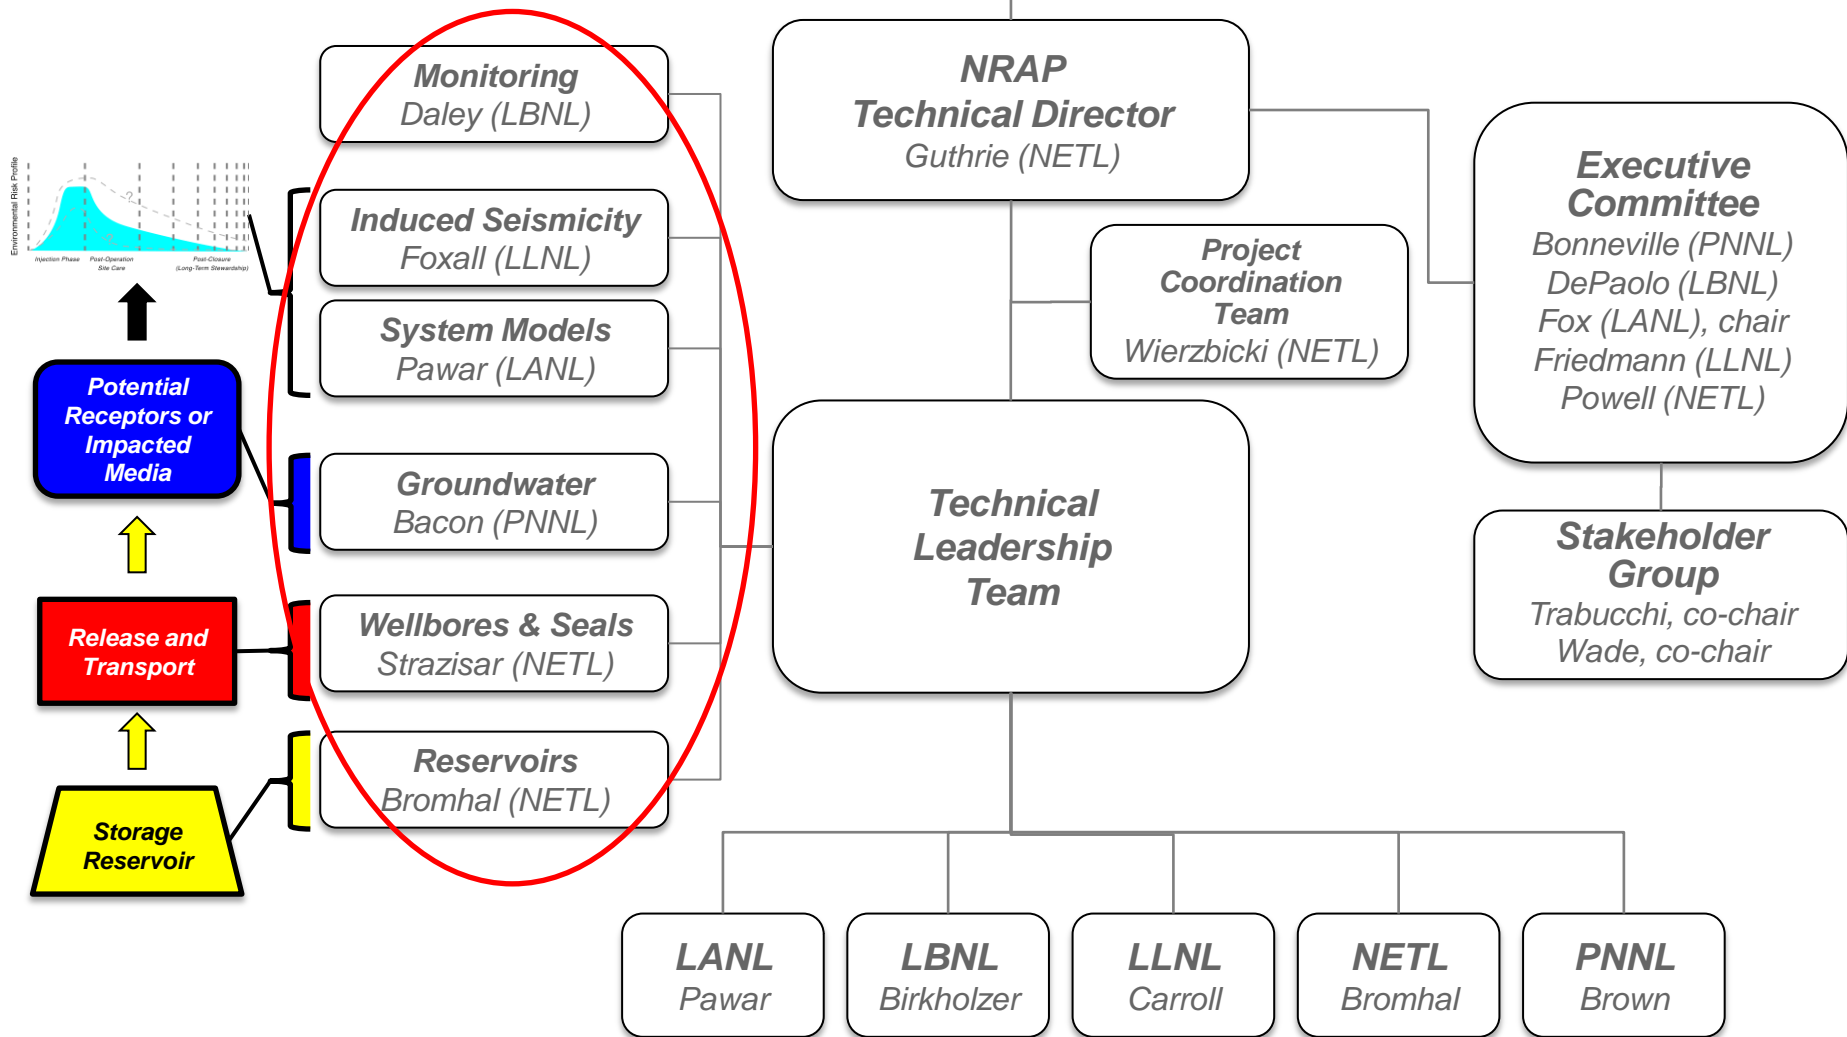

- How effective is geologic storage of CO<sub>2</sub> (e.g., will it leak)?
- What is the value of potential long-term liabilities?
- What is the most effective and efficient approach to environmental monitoring post injection?
- What are the best protocols to mitigate potential for induced seismicity?

## Two Key Goals

- develop toolset and supporting data for science-based risk assessments
  - ***already completed the first generation toolset to predict leakage impacts and potential for induced seismicity***
- build confidence in key storage-security relationships to support decisions
  - ***initiating phase to apply first generation toolset to elucidate storage-security relationships***

# NRAP Organizational Structure

# NRAP Approach to Quantifying System Performance

A. Divide system into discrete components

B. Develop detailed component models that are validated against lab/field data

C. Develop reduced-order models (ROMs) that rapidly reproduce component model predictions

Energy Data Exchange (EDX)

Data from RCSPs etc.

calibrate

validate

New Data from NRAP

calibrate

validate

IAM

NRAP Integrated Assessment (System) Models

Potential Receptors or Impacted Media

Release and Transport

Storage Reservoir

D. Link ROMs via integrated assessment models (IAMs) to predict system performance & risk; calibrate using lab/field data from NRAP and other sources

E. Develop strategic monitoring protocols that allow verification of predicted system performance

# Reservoirs

# Key NRAP Accomplishments/Results: Reservoirs

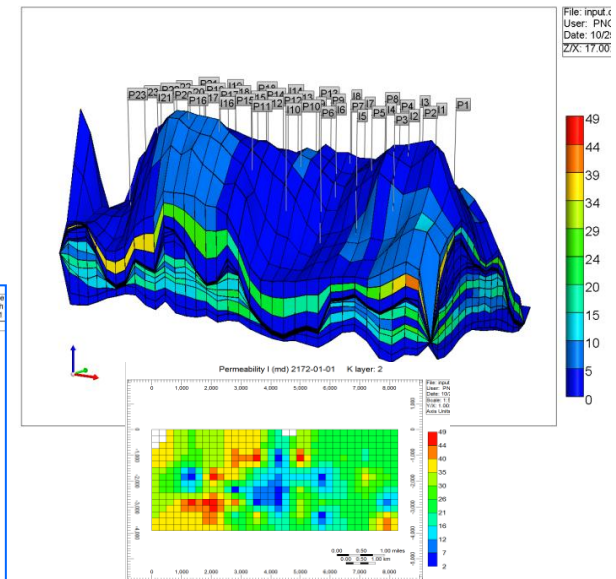

## Tool & Method Development

- Produced ROMs for three reservoirs
  - Kimberlina-like; 5 Mt/yr CO<sub>2</sub> (fixed) over 50 yrs injection only; 150 yrs relaxation; sandstone w/ interbedded shale & shale caprock
  - Otway-based; up to 0.5 Mt injection (variable rate) for 10 yrs; 500 yrs of relaxation; sandstone gas reservoir
  - SACROC-based; history-matched multiple well injection over 50 yrs; 1000 yrs of relaxation; carbonate reef EOR site
- Preliminary evaluations for 4 ROM approaches
  - Simple look up table
  - Surrogate reservoir model based on artificial intelligence
  - Polynomial chaos expansion
  - Gaussian regression analysis

## General Trends & Relationships

- Pressure and saturation at reservoir-seal interface is sensitive to only a few key subsurface parameters
  - Caprock permeability is key in predicting pressure relaxation

# SACROC Oil Field Model

- **Saline Sandstone Reservoir Within Depleted Gas Field**
  - Based on actual EOR field in West Texas (40 years of CO<sub>2</sub> injection)
  - Upscaled porosity and permeability model from University of Utah
  - 10 CMG simulations with history-matched model, begin after oil production completed
  - Allow injection for 50 years in several wells at a given wellhead pressure
  - Surrogate model based on artificial intelligence and data mining approach using neural networks

*Porosity*

*Permeability*

Permeability I (md) 2172-01-01

# Polynomial Chaos Expansion for SACROC ROM Development – Work in Progress

*Inputs:*

*Time (t)*

*k1, k2, k3, k4, ...*

*% of lithostatic pressure (pct)*

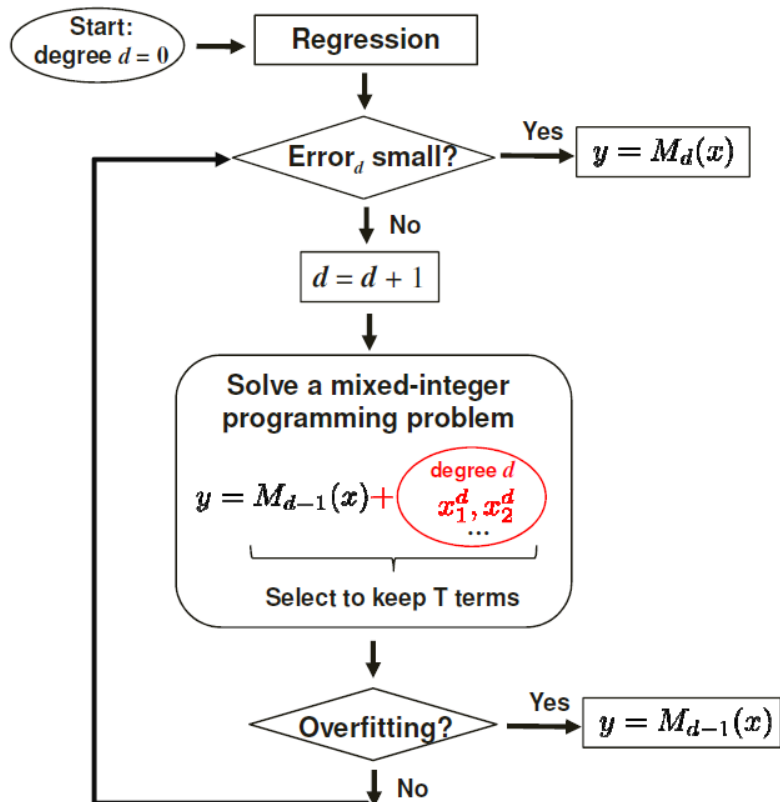

*Outputs of layer 18 gridblock:*

- Pressure
- Saturation(water, oil, CO2)

*Total PCEs = 544 gridblocks × 4 outputs  
= 2176 PCEs*

•Steps:

1. Design reservoir simulation inputs
2. Reservoir simulation
3. Train PCE model

# Migration Pathways (Wellbores and Seals)

# NRAP Migration Pathways Working Group

## Laboratory Experiments to Address Science Gaps

## Single Fracture Models to Simulate Opening/Closing of Flow Paths

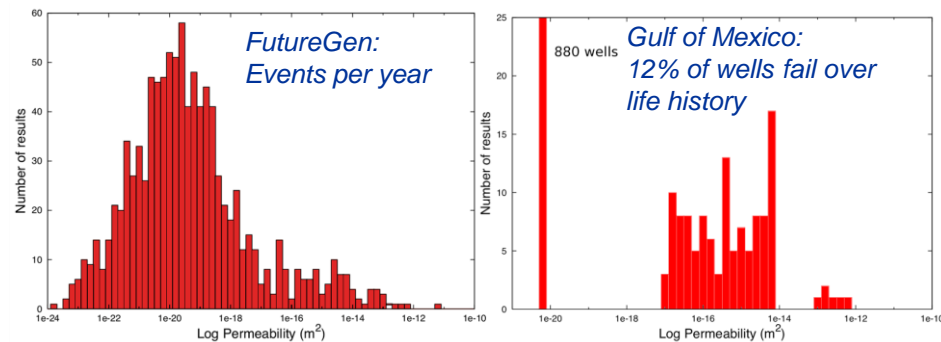

Aperture distributions (LHS) and pore-fluid velocities (RHS) from GEOS simulations of a natural fracture under atmospheric and 20 MPa confining pressure.

## Well Scale Reduced Order Models for Risk Profiles

## Field Data Analysis for Validation

# CO<sub>2</sub> and Wellbore Leakage Risk

- Experimental and numerical studies of flow through damaged cements.
- Objective is to predict time-dependant leak rates.
- Provide evidence for self limiting or self enhancing leakage.

# NSealR (NRAP Seal Barrier ROM)

NETL Graphics Dept.(2012)

# Groundwater

# Key NRAP Accomplishments/Results: Groundwater

## Tool & Method Development

- Established “no-impact” threshold values for two different classes of aquifers
  - High Plains confined sandstone aquifer
  - Edwards unconfined limestone aquifer
- Developed ROMs to predict impacts of CO<sub>2</sub> and brine leakage on pH, TDS and trace metals in each class of aquifer for MCL or “no-impact” thresholds
  - LLNL: sandstone, confined, 3D, multiple leaky wells, flow, transport, hydraulic heterogeneity, simple geochemistry
  - LBNL: sandstone, confined, 1D, complex geochemistry
  - LANL: limestone, unconfined, 3D, multiple leaky wells, flow, transport, hydraulic heterogeneity, simple geochemistry
  - PNNL: limestone, unconfined, 2D, complex geochemistry
- Developing linking functions to combine complex hydraulics and geochemistry ROMs for each class of aquifer
- Conducting experiments to determine impact of CO<sub>2</sub> leakage on major elements and trace metals using aquifer sediments from each class of aquifer

# Key NRAP Accomplishments/Results: Groundwater

## General Trends & Relationships

### • Confined Sandstone Aquifer:

- Adsorption/desorption is the most important process that controls trace-metal impacts due to the intrusion of CO<sub>2</sub>
- 0.01–0.1% of the CO<sub>2</sub> in the aquifer leaks to atmosphere
- Developed relationships to assess impact of metal-transport by brine on aquifer chemistry (for Cd, As, Pb, Cr)
- Chemical-Hydraulic linking function is a promising way to lower the computation load for derivation of ROM and improve prediction of volume affected by CO<sub>2</sub> intrusion

### • Unconfined Limestone Aquifer:

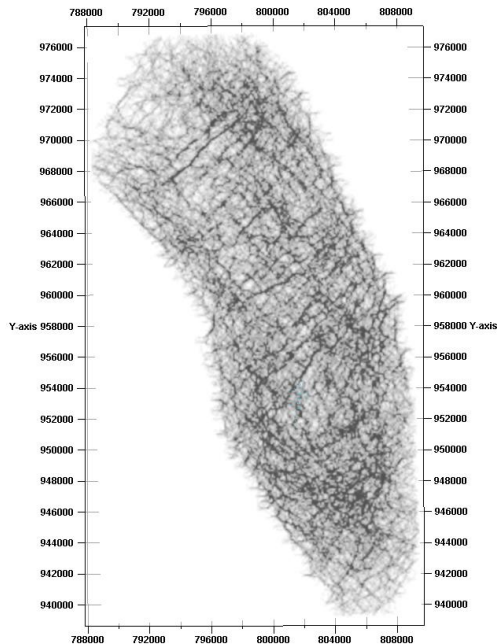

- Volume of pH impact is sensitive to CO<sub>2</sub> leak rate, total CO<sub>2</sub> mass, porosity and permeability
- Leak rates are most significant parameters for pH, TDS and trace metal concentrations, but carbonate equilibria and clay sorption are also important
- 69% of simulations have CO<sub>2</sub> atmospheric leak rates >0 and 52% of simulations have atmospheric leak rate >80% of wellbore leak rate
- Plume sizes for trace metals are notably larger using no-impact thresholds
- The quadratic and cubic ROMs for the 8 output variables are the best models

## Limestone Aquifer

# Monitoring

# Fault and Fracture Zone Detection and Reduced Order Fracture Model Development for Risk Assessment

*Teapot Dome*

*Post-stack enhancements adaptive to non-stationary signal*

*Appalachian Foreland, CONSOL/ZERT Pilot*

*San Juan Basin Pilot*

*Our efforts have been used to enhance possible fracture zones and fault networks and to identify potential leakage zones in three areas including the San Juan Basin (New Mexico), Teapot Dome (Wyoming) and the Central Appalachian foreland (West Virginia).*

# *Waveform Attribute Analysis to Detect Potentially Leaky Faults*

*Test case in a fractured reservoir. Note the enhanced imagery of reservoir and cap rock fractures*

# Fault

## Fault ROM dll in CO<sub>2</sub>-PENS

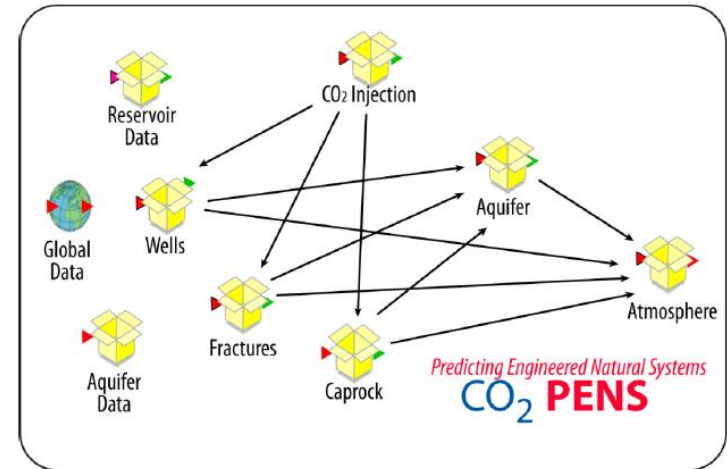

# Key NRAP Accomplishments/Results: System Models

## Tool & Method Development

- Developed first-ever integrated assessment model for predicting for leakage impacts
  - Approach integrated ROMs for storage reservoir, wellbores (open & cemented), faults and shallow aquifer
  - IAM used to generate risk profiles and associated uncertainties for three metrics (release to atmosphere, change in pH in shallow aquifer, change in TDS in shallow aquifer)
- Developed second generation IAM for leakage impacts
  - Updated first generation IAM with second generation ROMs
  - Second generation ROMs have increased process complexities and wider parameter range

## General Trends & Relationships

- Leakage Impacts
  - The calculated risk profiles show significantly different qualitative behavior compared to “Benson” profile
  - “Preliminary” risk profiles show extremely low risks for the three leakage metrics considered for first generation
  - Uncertainties in wellbore cement permeability dominate overall uncertainties

# Induced Seismicity

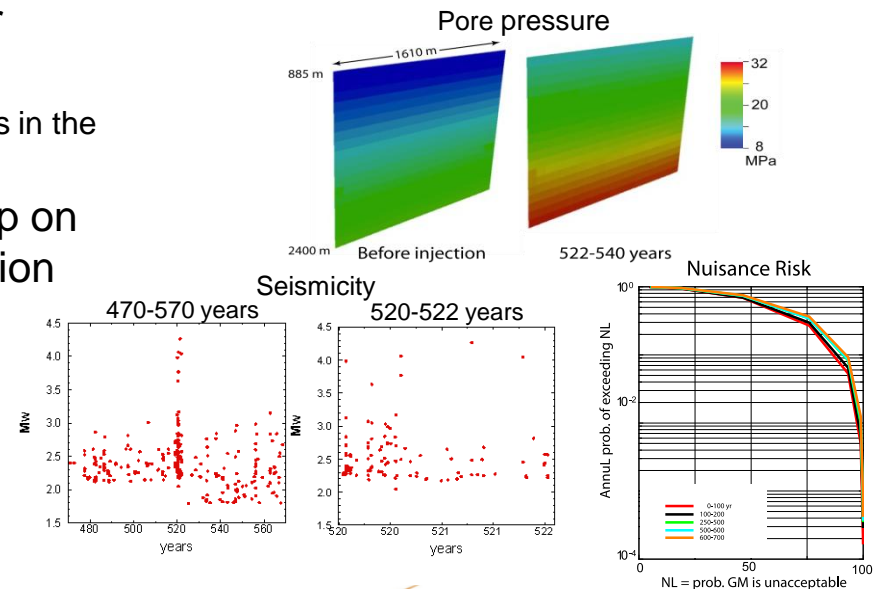

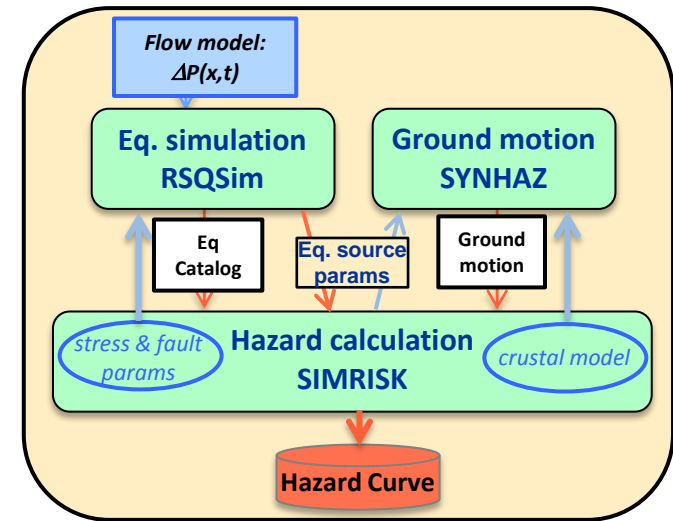

# Key NRAP Accomplishments/Results: Induced Seismicity

## Tool & Method Development

- Developed first-ever probabilistic seismic hazard assessment (PSHA) tool for induced seismicity
  - adapted widely accepted conventional PSHA approach
- Extending development to assess damage and nuisance (felt event) risks
  - demonstration application to realistic CO<sub>2</sub> injection scenarios

## General Trends & Relationships

- Rates of occurrence and sizes of earthquakes are determined by tectonic stress and reservoir pressure
  - sensitive to fault permeability and a few key parameters in the law governing the evolution of fault frictional strength
- Risk of CO<sub>2</sub> leakage may be affected by slip on faults during earthquakes, requires integration with systems leakage model

# Energy Data eXchange is being used as tech transfer mechanism for technical reports, tools, and datasets.

**Technical Report Series (TRS) and Peer-Reviewed Publications**

The NRAP Technical Report Series (TRS) is intended as a rapid, informal mechanism for producing a technical document that has been approved for public release. TRS are internally peer reviewed and can be downloaded as PDFs.

Each area of the block diagram at the right is hot-linked to a page listing the associated TRSs.

NRAP has also been actively publishing results in various peer-reviewed journals. Citations for these publications are also provided for each area.
